Dear Graham,

I hope this message finds you well.

Thank you for reaching out and for sharing the work you are doing with AllSpeak. It is very interesting, and I see some areas for potential collaboration.

There are a few ways AllSpeak could engage with UNESCO's work:

- 2003 Recommendation on Multilingualism and Universal Access to Cyberspace: We would be pleased to invite AllSpeak to contribute, as a non-governmental stakeholder, to the sixth consultation on its implementation: Call for contributions
- International Decade of Indigenous Languages (IDIL 2022-2032): We invite you to contribute to the IDIL mid-term process now: IDIL mid-term: share your planned activities and initiatives. You would also be welcome to join the IDIL community platform once it is available.
- Policy briefs and other initiatives: We are developing policy briefs and other initiatives, and could explore collaboration with AllSpeak in these areas.

I would be delighted to introduce my colleagues @Hu, Xianhong and @Castillo Parra, David, both in copy, to follow up with you further on potential collaborations. They are available to fix a meeting with you and discuss further when needed.

Kind regards,  
GCanela

**\*\*To:\*\*** Guilherme Canela de Souza Godoi, Director, Division for Digital Inclusion and Policies

Dear Mr Godoi,

I am writing to introduce a project that may be of interest to UNESCO's work on multilingualism in the digital era.

AllSpeak is an open-source programming tool that allows code to be written, read, and understood in any human language for which it has been implemented. Where conventional programming languages require English syntax, AllSpeak presents the same underlying logic in whichever language the programmer chooses from those available. It is currently operational in four languages - English, French, German, and Italian - and its architecture is designed to be extended to any language, including those using non-Latin scripts.

The project addresses a structural gap. Every mainstream programming language uses English keywords. This means that computational literacy - increasingly recognised as a foundational skill - is strongly biased towards those who can work comfortably in English. The 6.5 billion people worldwide who are not English speakers are, in effect, barred from understanding the

code that increasingly shapes their lives.

I was struck by UNESCO's Global Roadmap on Multilingualism in the Digital Era and its call for industry to "design inclusive Language Technologies". AllSpeak does this at the syntactic level: the code itself is in the learner's language, not merely the documentation around it. A companion white paper (available on Zenodo:

<https://doi.org/10.5281/zenodo.22018537>) describes the architecture, the methodology for adding new languages, and the real-world applications already running on it. A fifteen-minute narrated demonstration video

(<https://youtu.be/BSvh4MPEzV4>) shows AllSpeak building and running a graphical application from scratch.

A steadily increasing proportion of the world's code is now being written by AI, and that code must still be read, checked, and maintained by humans. AllSpeak is designed for this division of labour. AI has no trouble coding with AllSpeak when instructed to do so, and tends to make fewer mistakes in its small, constrained grammar than when writing in mainstream programming languages. The result is scripts that are far easier to read and understand, especially when they are written in the reader's native language.

I am an individual developer, not an organisation. I am writing not with a funding request but to ask whether AllSpeak might be of interest to UNESCO as a case study, a reference implementation, or a tool to share with language communities working towards digital participation. I would be glad to arrange a demonstration and to share the white paper and supporting materials.

With kind regards,

Graham Trott
